FOR IMMEDIATE RELEASE

July 26, 2014

Ayers Hotel Using New Water System

Ayres Resort & Spa in Paso Robles is now installing the HYDROGEN ACTIVATION (HA) System in its landscape water lines and the water lines in their vineyards and farmlands in order to reduce water costs and increase productivity and crop yields.

Las Vegas, Nevada, United States, July 26, 2014 - The Ayres Resort & Spa in Paso Robles is installing the HYDROGEN ACTIVATION (HA) System, a revolutionary liquid conversion process that changes the composition of ordinary water. The conversion causes the water to dissolve the minerals and salts that have accumulated in the soil and carries them below the root level. Water usage is reduced by 50%. Drainage is increased. Bountiful crop yields are expected. This new water system is ideal for agriculture, golf courses and parks.

All Agricultural Water usage is reduced by 50% with the HYDROGEN ACTIVATOR (HA). The HA is a must have tool for water conservation. It is a cost cutter for hotels, vineyards, farms, agricultural projects, golf courses, parks, sports parks, schools, sod farms, turf maintenance, etc.

BIGGER BETTER CROPS (BBC) is a Division of ALLGONE LLC. BBC manufactures and distributes the HYDROGEN ACTIVATOR (HA). The HA was developed to meet the needs of societies facing droughts. It is essential for water conservation and management. The world needs water. The world needs food. The HA conserves water and helps to grow bigger better food crops.

The HYDROGEN ACTIVATOR

- Reduces water usage by as much as 50% due to more efficient moisture utilization and by lowering surface tension, which allows better absorption by plants.
- Reduces salt accumulation. Drives salt below the root zone.
- Reduces fertilizer usage because high soluble water equals more efficient distribution of nutrients.
- Helps increase the loam effect in soil and improves drainage, which conditions the soil and improves nutrition levels, thus improving product quality and yield.

HYDROGEN ACTIVATION (HA) SYSTEM conversion process enhances the "effect of polarization" and Hydrogen bond formation. This occurs as water is streamed through the special sintered ceramic bead ore clusters. It breaks up the minerals and salts that have formed an aggregate in the soil and allows them to drain below the roots, so the roots can grow easier.

KB Distributing is the Official Nevada Representative for BIGGER BETTER CROPS (BBC) and Distributor for the HYDROGEN ACTIVATOR (HA). The company was established in 2004 and is expanding into this exciting new field.
